

jORCA: easily integration

jORCA is a Java desktop Client to efficiently access any type of web services repositories by mapping metadata over a virtual definition enabling scalable service discovery and achieving flexible tools inter-communication.

jORCA can be defined in three words: usability, extensibility and integration.

jORCA is an user-friendly advanced Web-resources integration tool, with the following features:

Broad access to repositories:

- Moby-Central at moby.ucalgary.ca
- MOWServ www.inab.org/MOWServ (INB)
- ACGT at <http://chirimoyo.ac.uma.es/acgt>
- WSDL (e.g. EBI web services) and Taverna
- and ... easily extensible to other repositories

New types of data can be described even with local file specifications.

Diverse invocation protocols: BioMoby, local scripts, command line, grid secure execution ...

Broadly customizable: initial links, look and feel, by default settings ...

Web service discovering engine (google-like): 'did you mean' suggestions and user profiling.

Automatic workflows composition: from source to target data through a set of pipelined services.

Learning from user experience:

- Drag and drop edition styles.
- Wizards assistance for data standardization.
- New service invocation models can be easily added.
- Easy incorporation of viewers for specific data types (text config).
- Custom Favorite's section for fast access.
- On-line updated documentation, help, training and getting started guides.

jORCA works with a cache system to accelerate data retrieval (typically around five seconds are needed to re-load the cache). Pre-fetched cache files are provided in the installation kit for the main repositories

DISCOVERING OF RESULTS WITH **jORCA**

Several methods are provided to help user to identify appropriated data with the desired tool:

- Input text box for fast search.
- Compatible services related to a file.
- Advanced keyword-based searching.
- 'Did you mean' suggestions.

USING TOOLS

- Automatic interface builder.
- Pipelining of results (I/O compatibility).
- Mirroring of services (scheduling).
- Asynchronous calls.
- Execution tracing (editable log with record of events).

STANDARDIZING DATA

- Support input data via clipboard.
- Object and Collection Editors.
- On-the-fly object creation services.

VISUALIZATION TOOLS

- Provides full interaction for browsing and exploring results.
- System assistance to identify file content.
- Customizable link between types of data and associated viewers (text config. file).

FILE SYSTEM

- Local file system management.
- Heuristics to determine the file type.
- Edit your files with the object editor.
- Specialized and default viewers for object's files.
- Launch tools directly from the file system.

EXTENDING iORCA

- Programmatic Java API to incorporate new repositories and service invocation methods.
- Any type of tool repository resource can be added by simple mapping on virtual metadata model.

Availability:

- Just download, un-compress, launch and start to enjoy *iORCA* (freely available at www.bitlab-es.com/orca)

Minimum Requirements:

OS Supported:

- Windows 9x/Nt4/Win2k/WinXP/Vista
- Unix-Like: Kernel: 2.6 or later, XFree86-4.0 or later.

Pentium IV 1.5GHz or faster. 512 MB RAM (1GB recommended), 50 MB free hard disk space

Needs Java Virtual Machine 6.x or later.

Contact Information:

Ask for team support to develop new access methods to map new repositories and to define new invocation and visualization methods.
